

Multivariate Difference Score Models for Body Dissatisfaction

Original Source: Gervais, S. J., Vescio, T. K., & Allen, J. (2011). When what you see is what you get: The consequences of the objectifying gaze for women and men. *Psychology of Women Quarterly*, 35(1), 5-17.

One minor question in this paper focused on gender differences in how discrepant the people felt their bodies were from their own ideals. To measure this, participants completed the Figure Rating Scale, which has pictures of nine bodies varying from extremely thin (0) to extremely overweight (10). Participants provided one rating for their *actual* body and another for their *ideal* body. Thus, the focus of the analysis was the difference score between these actual and ideal ratings for each person. Using a difference score as a DV is highly problematic, in that all information about the absolute amount of the original variables is lost. Here is a better way through a multivariate regression. These results use ML and differ slightly from actual results presented in the paper.

SAS Syntax and Output for Data Manipulation:

```
TITLE "Descriptive Info for Body Ratings by Gender";
PROC UNIVARIATE DATA=object_multiv; BY gender; VAR body5 body1;
    HISTOGRAM body5 body1 / NORMAL(COLOR=(blue) MU=est SIGMA=est)
    MIDPOINTS= -.5 to 10.5 by 1;
RUN;
```

Notice how the means and standard deviations differ by gender and rating type...

```
* Stack data into multivariate format (one row per person per DV);
DATA object_stacked; SET object_multiv;
  dv="Actual"; body=body5; OUTPUT;
  dv="Ideal "; body=body1; OUTPUT;
  LABEL body= "Body Size Rating (0=most thin)"; RUN;
```

Empty Multivariate Model Predicting Body Ratings (using Multivariate Normal Distribution and Identity Link): This model predicts the rating d for person $p \rightarrow Rating_{pd} = \beta_0 + \beta_1 RatingType_{pd} + e_{pd}$

```
TITLE "Empty Model: Differences between Actual and Ideal Figure Rating Scale";
PROC MIXED DATA=object_stacked COVTEST IC NAMELEN=50 METHOD=ML;
  CLASS dv;
  MODEL body = dv / SOLUTION DDFM=KR;
  REPEATED dv / R RCORR TYPE=UN SUBJECT=pin;
  ESTIMATE "Sample mean for Actual Rating" intercept 1 dv 1 0;
  ESTIMATE "Sample mean for Ideal Rating" intercept 1 dv 0 1; RUN;
```
