## From Between-Person to Within-Person Models for Longitudinal Data

The models for this example come from Hoffman (2015) chapter 3 example 3a. We will be examining the extent to which a learning achievement outcome) can be predicted from group (control as the reference vs. treatment) and time (pre-test as the reference vs. post-test) in a sample of 50 children.

## SAS Syntax and Output for Data Manipulation:

```
* Defining global variable for file location to be replaced in code below;
%LET filesave= C:\Dropbox\17_CLDP944\CLP944_Example03a;
* Location for SAS files for these models (uses macro variable filesave);
LIBNAME filesave "&filesave.";
* Import and stack chapter 3 two-occasion multivariate data;
* Create new variable on left from old variable on right, OUTPUT writes data;
DATA work.Chapter3a; SET filesave.SAS_Chapter3a;
time=1; outcome=outcome1; OUTPUT;
time=2; outcome=outcome2; OUTPUT;
DROP outcome1 outcome2;
LABEL time = "time: Occasion (1=pre-test, 2=post-test)"
      outcome = "outcome: Learning Outcome"; RUN;
* Center predictors for analysis;
DATA work.Chapter3a; SET work.Chapter3a;
time1 = time - 1; treat = group - 1;
LABEL time1 = "time1: Time (0=pre-test, 1=post-test)"
      treat = "treat: Treatment Group (0=control, 1=treatment)"; RUN;
```

\* CLASS= means per group and time, WAYS= means overall=0, per category=1, per cell=2; TITLE1 "Chapter 3a Example: Means by group and time for learning outcome"; PROC MEANS MEAN STDERR MIN MAX DATA=work.Chapter3a; CLASS group time; WAYS 0 1 2; VAR outcome; RUN; TITLE1;

#### Cell means by group and time for y outcome

Treatment Group (1=control, 2=treatment)	Time (1=pre-test 2=post-test)	N Obs	Mean	Std Error	Minimum	Maximum
1	1	25	49.0767977	1.1370576	37.5335041	59.5504810
	2	25	54.8991630	1.1256529	44.5615778	67.1060321
2	1	25	50.7587396	0.9070808	40.5321932	62.1309134
	2	25	58.6236314	0.9864754	47.4303443	68.6163028

#### Marginal means by group for y outcome

Treatment Group

(1=control, 2=treatment)	N Obs	Mean	Std Error	Minimum	Maximum
1	50	51.9879804	0.8943692	37.5335041	67.1060321
	50	54.6911855	0.8691455	40.5321932	68.6163028

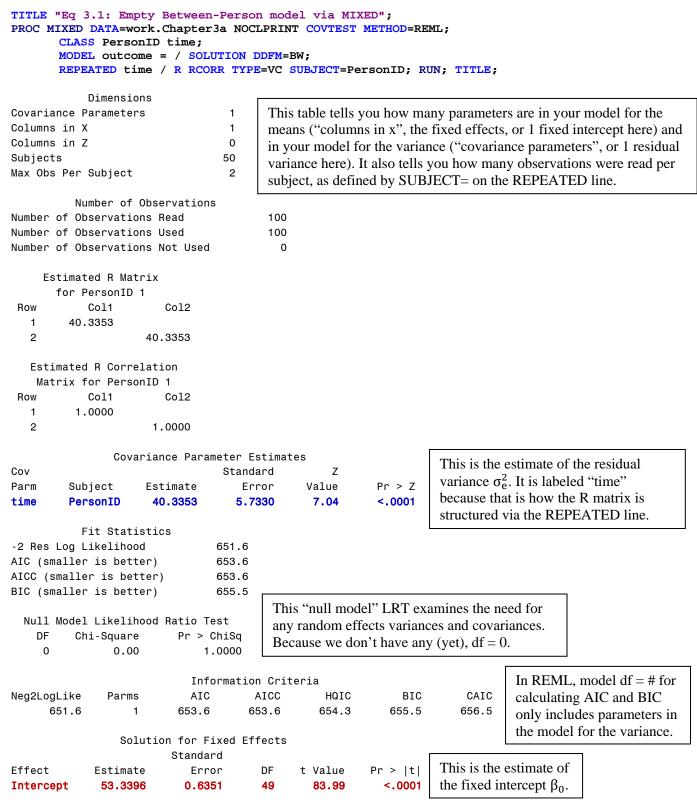

#### Marginal means by time for y outcome

lime (1=pre-test)	Ν				
2=post-test)	Obs	Mean	Std Error	Minimum	Maximum
1	50	49.9177687	0.7297690	37.5335041	62.1309134
2	50	56.7613972	0.7870204	44.5615778	68.6163028

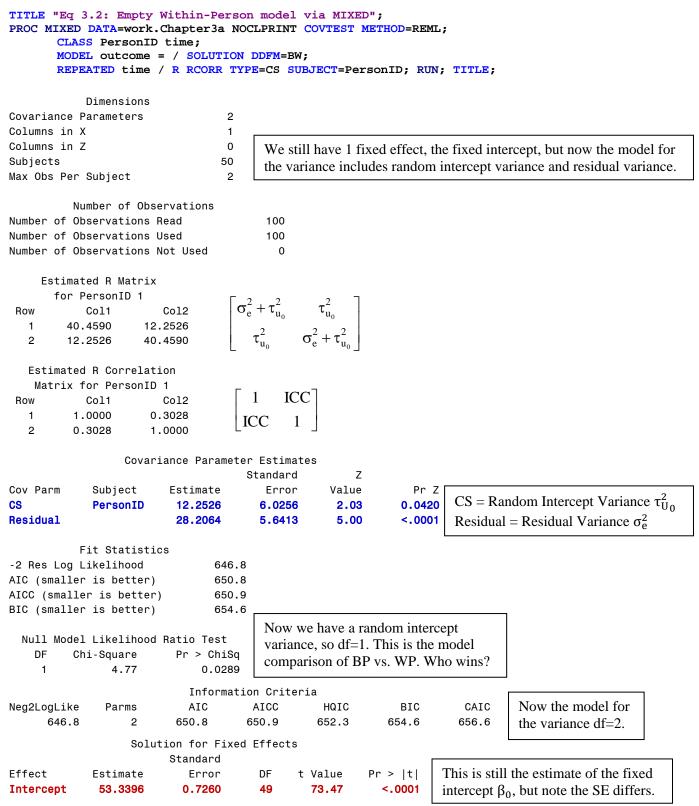

### Grand mean for y outcome

Mean	Std Error	Minimum	Maximum
53.3395829	0.6351006	37.5335041	68.6163028

# <u>**3.1: Between-Person Empty Model</u>** $y_{ti} = \beta_0 + e_{ti}$ </u>

# <u>3.2: Within-Person Empty Model</u> $y_{ti} = \beta_0 + U_{0i} + e_{ti}$

Which is the better empty model, and how do you know?

What is the ICC for these data and what does it mean?

### 3.7 (top): Between-Person Conditional Model

```
\mathbf{v}_{ti} = \beta_0 + \beta_1(\text{Time}_{ti}) + \beta_2(\text{Group}_i) + \beta_3(\text{Time}_{ti})(\text{Group}_i) + \mathbf{e}_{ti}
